DURIUM® MODIFIED POLYESTER ENAMEL

This unique coating is a melamine cross-linked thermoset baking polyester modified with an acrylic copolymer to enhance performance requirements such as exterior durability, detergent and chemical resistance.

Durium® is a high performance coating which is designed to be both hard and flexible.

Durium® coatings exhibit excellent gloss and color retention under accelerated and actual weathering conditions, and are designed to have superior adhesion over a variety of substrates.

These finishes are suitable for interior and exterior applications.

Key elements for the application are that the coating is formulated to be high solids, meaning low solvent (VOC) content, low HAPs (Hazardous Air Pollutants) and is free of any toxic heavy metals.

Besides being the ideal coating for indoor/outdoor casual furniture, Durium® is versatile enough to be used for many other applications.
