

FOR THOSE WITH LCI E90 09+ HALOGENS SETUP THAT WANT ANGEL EYES, YOU CAN ALSO PURCHASE THIS ITEM

here is a DIY guide to install Angel Eyes on all Halogen headlights for E90 LCI's without xenon setup

**1. OEM LCI Halogen headlight housing**

**2. Rear covers removed**

**3. Angel eye bulb is located at the bottom**

**4. After removing the OEM angel eye bulb and bracket assembly**

**5. Disassembling the OEM angel eye unit. There are three major components: 1) AE bulb (H10W) screwed into a reflector socket; 2) glass piece (heat shield?) held inside a metal bracket; 3) plastic support bracket.**

**6. Removed the (white) OEM connectors and crimped on two new female connectors ([22-18 AWG](#))**

**7. Attached the RD LED bulb to the plastic support bracket by using two 1-inch long self-tapping screws. The metal frame containing the glass piece/heat shield was not reinstalled since the RD LED could only be secured in place by having the screws penetrate through the plastic support bracket to the other side. Moreover, I've heard somewhere that these types of LED bulbs "shouldn't generate that much heat..."**
