# INSTALLATION GUIDE

## CEILING ANCHOR POINTS

1. Mark the ceiling with two anchor points, the distance between them equal to the length of the strip light (approximately 44 inches).
2. Drill two pilot holes on the marks.
3. If you are installing the strip light on drywall or ceiling tiles, drill holes suitable to fit the wall plugs and then insert the wall plugs.
4. Insert the screws into the mounting studs. With the flange toward the ceiling, screw the studs firmly into the ceiling on both anchor points.

## ATTACHING THE LONGER CABLE

The longer cables have a hook at one end and are free at the other end

1. Thread the free end of the cable through each threaded fitting and through the side hole of each stud.
2. Screw the threaded fittings into the mounting studs on each anchor point.
3. Adjust the length of the cables to approximately the required length by pulling the cables through the spring-loaded holes of the studs.

## ADJUSTING THE HANGING HEIGHT

1. To make the hanging length shorter, simply pull the long cable through the spring-loaded holes in the hanging studs.
2. To make the hanging length longer, push the release buttons on the side of the spring-loaded studs and pull the cable back.

Once the light fitting has been mounted and adjusted to the required height, there may be excess cable protruding from the stud holes. To allow future re-location of the light fitting, it is not recommended that this excess be cut off, but coiled and tied.
